On the basis of results provided by studies on the work
 of the cultivator on slopes the following conclusions may
 be drawn: (1) The angle of throw increases on compact
 soils; (2) Round-trip passage of the cultivator along the
 contour line results in larger downward displacement of
 soil particles in places where the first passage had been
 effected down the slope; (3) The first passage along the
 contour line brings about larger displacement of soil

Harrow operation on a slope along the contour line in-
creased soil particles displacement approximately 10.5 cm down
the slope. Average, upward and downward displace-
ments along the largest slope gradient are 12.8 cm and
34.8 cm respectively. The work harrow at an angle of
45° to the contour line produces upward and downward
displacements of 7.5 cm and 25.1 cm respectively. An
anti-erosive effect of cultivation may be attained if the

A new determination of the radius of Venus was made
using occultations of Regulus and including previously
unknown observations. Auwers' value of the radius
 $8''.41 = 6100 \pm 30$ km received full confirmation. Pos-
sible corrections to this value are given in table 3
